

To,
The Visa Officer,
Embassy of Australia,
Dhaka, Bangladesh

Subject: Application for Student Visa (Subclass 500) Master of Information Technology (62510), University of Western Australia, Perth, Western Australia

Dear Visa Officer,

My name is Sanjana Akter Roshni, and I am a Bangladeshi citizen (Passport No: **A21053837**). I am writing to apply for a Student Visa (Subclass 500) for the Master of Information Technology (course code 62510) at **the University of Western Australia (UWA)**, Perth, Western Australia. I have a BSc in **Computer Science and Engineering** from Ahsanullah University of Science and Technology (AUST), which I completed in 2023, and I have been working as a Full Stack Developer since May 2024.

I live at 324/A, East Rampura, Dhaka with my husband Hasibul Hoque. We got married on 11 August 2023 and he will travel to Australia as my dependent.

Academic Background

I completed my BSc in Computer Science and Engineering at Ahsanullah University of Science and Technology (AUST) in Dhaka, enrolling in 2019 and graduating in 2023. Over those four years, I studied subjects like programming, data structure and algorithms, database systems, software engineering, networking, and systems analysis. These gave me a strong base in computing fundamentals, and I still rely on much of what I learned there in my current job.

The program gave me a strong foundation in core computing concepts, but it mainly focused on theoretical learning. Software engineering was taught only as a single introductory subject, without covering advanced topics like agile methods, requirements engineering, or software quality assurance in depth. Networking and systems were also taught at a basic undergraduate level. Databases mainly covered SQL and relational database concepts, without exploring areas like cloud databases, or high-performance query processing.

The Master of Information Technology at UWA feels like a genuine academic progression rather than just repeating my past studies because its curriculum directly targets these gaps across three distinct areas:

- **Software Systems:** To transition from basic coding to enterprise design, I need a rigorous framework for building reliable applications. Units like Software Requirements and Design (CITS4401), Software Testing and Quality Assurance (CITS5501), and Agile Web Development (CITS5505) will give me the structured engineering methodologies I currently lack in my day-to-day delivery processes.
- **Applied Computing:** Since I deal with transactional systems every day, understanding infrastructure is critical. This stream plugs a major gap in my profile by offering formal training in Cloud Computing (CITS5503), Open-Source Tools and Scripting (CITS4407)- areas I navigate purely by trial and error right now.
- **Artificial Intelligence:** To prepare for the future of intelligent automation in enterprise platforms, I need to move beyond fixed business rules. Mastering Machine Learning (CITS5508), Natural Language Processing (CITS4012), and Artificial Intelligence and Adaptive Systems (CITS4404) will give me the technical capability to build smart, data-driven systems.

Finally, the IT Capstone Project (CITS5206) ties all three of these streams together through applied, hands-on research. This is a level of practical execution that my undergraduate program simply didn't offer, and it is exactly the bridge I need to transition from writing code as a developer to designing large-scale enterprise architecture.

Professional Experience

Since May 2024, I have been working as a Programmer (Full Stack Developer) at **Computer Ease Limited** in Dhaka. My day-to-day work involves building enterprise software for financial and transactional systems. I regularly use C#, .NET Framework, SQL Server, and Angular. On the backend, I write REST APIs, build payment processing services, and develop transaction validation systems. I have also integrated third-party APIs, including **bKash** and **SMS gateways** into our platforms. On the frontend, I work with Angular and Kendo UI to build data dashboards and user interfaces.

So far, I have contributed to several major systems, including an EFT Payment System (National Exchange Money Transfer), an Enterprise Sales and Reporting System (Orion Sales), and an Operational Dashboard and Visit Planning System. These projects exposed me to the

practical realities of enterprise software development, particularly in environments where security, reliability, reporting accuracy, and high transaction volumes are essential.

While this experience has strengthened my development skills, it has also shown me the limitations of my current technical knowledge. For example, I regularly work with systems deployed across cloud and network environments, yet I have never formally studied cloud architecture, distributed infrastructure, or deployment engineering. Similarly, although I participate in software delivery processes every day, I lack formal training in advanced software quality practices, scalable system design, and structured project engineering methodologies.

Another area that increasingly interests me is intelligent automation. Many of the systems I currently work on still rely heavily on fixed business rules and manual decision flows. Through working with transactional and financial data, I have realized how technologies such as machine learning and intelligent pattern analysis can improve fraud detection, operational efficiency, and automated decision-making within enterprise platforms.

These professional experiences are the primary reason I am pursuing higher education now. I do not want to remain limited to application-level coding alone. I want to develop the ability to design, manage, and improve enterprise systems at a deeper architectural and strategic level.

Why Australia and the University of Western Australia

Before applying, I looked at the UK, Canada, and Australia as possible study destinations. The UK has good universities, but they offer one-year master's programs, which do not provide enough time to gain practical knowledge. Canada was another option I considered, but recent changes to their study permit policies have created a lot of uncertainty for international students, and I was not comfortable with that risk. Australia felt like the most stable and practical choice. It has a clear student visa process, ACS-accredited IT programs, and post-study work rights through the Temporary Graduate (Subclass 485) visa, which is an important factor for someone in the IT field.

I chose Perth over Sydney and Melbourne because it is more affordable. According to Numbeo's 2024 data, Perth is roughly 15 to 20 percent cheaper in terms of rent, transport, and

everyday costs. I plan to share an apartment near the campus for around AUD 200-350 per week and travel to UWA via the Claremont or Daglish train stations on the Fremantle Line.

Before choosing The University of Western Australia (UWA), I carefully evaluated the postgraduate information technology options across all major universities in Perth. While each institution possesses distinct strengths, a direct comparison of their curriculum depth, global academic standings, and long-term career alignment confirmed that UWA was the ideal fit for my future career.

- **Murdoch University:** While its IT programs offer solid, broad practical exposure, a close inspection of the curriculum revealed it lacked the advanced technical depth and research intensity required for the direction I want to pursue.
- **Curtin University:** Despite its strong reputation in applied technology, its master's offerings—particularly the Master of Information Systems and Technology—lean heavily toward business-oriented IT transformation, data management, and governance. It lacks the balanced focus on advanced software architecture and artificial intelligence that I need.
- **Edith Cowan University (ECU):** While highly accessible and focused on general professional preparation, the coursework is tailored more toward foundational IT training rather than the highly specialized, research-backed engineering environment expected at the postgraduate level.

Beyond the curriculum, university standing was a major factor for me. UWA consistently ranks in the global Top 100 (sitting at #77 in the QS World Rankings), which puts it a step ahead of Curtin (Top 200), Murdoch (Top 500), and ECU (Top 600). Being a Group of Eight institution means UWA provides a level of research culture, advanced computing labs, and industry prestige that the other universities simply can't match.

At the end of the day, UWA's Master of Information Technology just felt like the most natural next step for me. It doesn't waste time rehashing basic IT concepts. Instead, the modules directly hit on the exact challenges I face daily in enterprise systems—like cloud environments, software quality engineering, and intelligent systems. It's exactly the bridge I need to transition from writing code as a developer to designing and managing large-scale enterprise architecture.

Why Not Bangladesh

I did look into local options before going this route. BRAC University and United International University (UIU) both offer postgraduate Computer Science programs, and I have nothing against them academically. But neither of them has a master's program in Information Technology with ACS Professional accreditation at this level, and neither can offer the industry-linked, internationally benchmarked facilities that UWA provides. It is not that local universities are not good, it is just that this specific combination of global ranking, ACS accreditation, curriculum depth, and professional infrastructure is not currently available in Bangladesh.

Financial Capacity and Sponsorship

My studies will be fully covered by three sponsors. Notarised affidavits from all three and verified digital bank statements covering three to six months are attached to this application. My father, Md. Shahadat Hossain Shaheen, is the primary sponsor. He owns and runs Sydney Homes Ltd, a registered real estate company in Dhaka. He holds a Fixed Deposit Receipt of BDT 50,00,000 (around AUD 56,186) with Uttara Bank PLC and his verified annual business income from Sydney Homes Ltd is BDT 35,50,000 (AUD 39,892). He also owns land in Dhaka, a 0.825 decimal plot in South City Khilgaon and a 10.30 decimal plot in Kazirgaon, Munshiganj with a combined value of approximately AUD 123,609.

My mother-in-law, Mrs. Nasima Akter, is the secondary sponsor. She has a Mudaraba Term Deposit of BDT 40,00,000 (approximately AUD 44,949) and earns about AUD 15,507 a year in rental income from flats and shops she owns in Dhaka. Her total immovable property is valued at roughly AUD 427,014. My father-in-law, Md. Momtazul Hoque, is the tertiary sponsor. He is a retired Government Engineer drawing a verified annual pension of BDT 4,63,423 (AUD 5,208) and holds immovable assets worth approximately AUD 129,228 in Dhaka.

All three sponsors together hold verified assets of roughly AUD 862,903 and earn a combined annual income of about AUD 60,607. That is well above the DHA minimum living requirement of AUD 29,710 per year and is enough to cover my tuition, living costs, and travel for the full two years. I should also mention that a 1,450 sq. ft. flat (Flat No. 8-C, 9th Floor) in Dhaka has been formally allotted to me by deed of agreement in my own name which is something I see as both a personal tie and a documented commitment to returning home.

Family Ties and Return Intent

The absolute strongest anchor tying me back to Bangladesh is my life with my husband, Hasibul Hoque (Passport No: A03116434). We got married on August 11, 2023, and have been building our home and future together in Dhaka ever since. Hasibul is an established Software Engineer with over three years of experience specializing in Java backend systems, microservices, and enterprise banking software. He has a thriving career right here, and Bangladesh is where we see our long-term future as a couple.

He is joining me in Australia as my dependent purely because of my studies. Moving across the world is a massive step for me. I have never lived or even traveled entirely on my own before. Having my husband by my side will give me the emotional and practical support I need in an unfamiliar environment. With his help to navigate the logistics of settling into a new country, I will be able to truly focus and pour all my energy into my demanding master's program. Once I complete my degree, we fully intend to return home together to resume our lives and careers in Bangladesh.

All of my immediate family: my parents, my siblings, and extended relatives live in Bangladesh. I am also closely involved in my father's business, Sydney Homes Ltd, based in Dhaka, and I expect to play a more active role in that as my technical skills grow. The flat allotted to me in Dhaka by deed of agreement is something I genuinely think of as our future home. My husband also has Mudaraba Term Deposits of approximately AUD 5,833 in Bangladesh, which shows that our financial foundations are here, not abroad.

I have never left Bangladesh before. I have no relatives in Australia, no prior visa history of any kind, no military obligations, and no involvement in civil unrest. Going to Australia is about getting an education - nothing more. Everything else in my life is here: my family, my property, my career plans, my marriage. Returning after my studies is not a condition I have reluctantly accepted. It is genuinely what I want to do.

Career Goals

Bangladesh's technology industry is growing fast. The government's Smart Bangladesh Vision 2041 has placed enterprise software, cloud infrastructure, AI-driven systems, and digital transformation at the center of national development, and companies are actively looking for professionals who can work across all of those layers. Right now, there is a real gap between what the market needs and what local graduates can offer — particularly in advanced software engineering, applied AI, and cloud-based system design. Coming back with an ACS-accredited master's from UWA will put me in a strong position to fill that gap.

My immediate goal after returning is to step into a senior technical role — as a Software Architect, Cloud Solutions Engineer, or AI-ML Engineer — at a company-like Brain Station 23, WellDev, Therap BD, or Reve Systems. These are companies that build products at the intersection of enterprise software and intelligent systems, which is exactly where my UWA training will apply. IT professionals in Bangladesh with internationally accredited postgraduate qualifications earn between BDT 1,20,000 and 2,50,000 per month, compared to BDT 50,000 to 80,000 for locally trained graduates. Financially, returning home makes far more sense than staying abroad. Further down the line, I want to co-found a tech company with my husband that builds intelligent enterprise software for real estate, fintech, and healthcare — sectors where both of us have direct hands-on experience and where the combination of applied computing, AI, and software systems knowledge will be most valuable. My father's background in real estate through Sydney Homes Ltd adds an additional layer of domain knowledge we can draw on. All of this is anchored in Bangladesh.

Visa Conditions and Conclusion

I understand the conditions attached to the Student Visa Subclass 500 and I will follow them. I will stay enrolled full-time, keep my attendance above 80%, stick to the 48-hour per fortnight work limit during semesters, and maintain valid Overseas Student Health Cover (OSHC) throughout my stay. I am going to Australia to study, and that is the only reason.

I am a genuine student. I have a clear reason for this degree, real professional experience that makes the course directly relevant across all three of its specialisations, three financially capable sponsors, and strong personal ties to Bangladesh through my family, my property, my husband's career, and my own career plans. The Master of Information Technology at UWA is the right next step for me, and it is one I cannot take locally. I sincerely request that this application be looked upon favorably. Thank you for your time and consideration.

Yours Sincerely,

Sanjana Akter Roshni
